

Every JavaScript action a PDF file can have

Each action below writes one line into the log field, so you can watch the order of events.

Runs when the file is opened

document-level JavaScript (/Names /JavaScript) - neither switch can turn this one off
OpenAction (/OpenAction) - needs "enable Open Action JavaScript", shows an alert
PageOpen (page /AA /O) - fires again for every page you scroll to

Runs later - all of these need "enable Catalog AA JavaScript"

WillPrint and DidPrint (/AA /WP and /DP) - press Ctrl+P
WillSave and DidSave (/AA /WS and /DS) - click the download button
WillClose (/AA /WC) - in this file, but pdf.js drops it while closing the document
PageClose (page /AA /C) - scroll away from a page

Click into the log field first, then press Ctrl+P.

pdf.js only shows an alert when you interacted with the document during the last five seconds, and printing itself does not count. Without that click, WillPrint writes to the log but stays silent.

Page 2

Scrolling here fired PageClose on page 1 and PageOpen on this page.

Scroll back to page 1 to read the log.
